AXPRO provides AI-driven <u>video recording</u> and <u>real-time rewards</u> in one unified system - "built to catch what others miss, and act before it's too late."

INTELLIGENT TAX

Intelligent Tax (iTax) is a regulatory tool which utilizes AI driven technology to detect taxable winnings, provides screenshot and video option for seamless access and review. iTax identifies videos containing taxable winnings, marking the exact occurrence time and corresponding winning amount in the analysis logs, iTax improves tax compliance and minimizes human errors.

Value for Regulatory Authorities

Regulatory authorities face significant challenges in monitoring casino operations, ensuring tax compliance, and maintaining market fairness. Traditional surveillance systems have led to inefficient regulatory enforcement due to a lack of centralized data, difficulty in information retrieval, and extensive manual effort.

iTax provides a more precise, data-driven regulatory tool by recording and categorizing all slot machine activity in real time, which ensures comprehensive and traceable historical records. This allows faster event retrieval, more accurate violation detection, and AI-powered taxable win identification, improving compliance and minimizing human errors.

With this technology, regulatory authorities can enforce compliance more effectively, enhance market transparency and drive standardized industry practices, ensuring a fairer and more sustainable gaming environment.

iTax revolutionizes the processing of W-2G tax requirements through the advanced automated AI technology in the United States. iTax is designed to improve speed and efficiency, ensuring compliance with regulatory demands effectively.

Benefits for Casino Operators

Similar functionalities can be implemented for casino operators globally. This could significantly enhance their capacity to meet various regulatory requirements, including tax and Anti-Money Laundering (AML) processes.

Expanding this AI-driven capability globally promises streamlined compliance and reduced operational burdens for international operators navigating complex financial regulations.

Machine downtime during document processing can be significantly reduced and resulted in an increase in Gross Gaming Revenue.
